

ADVICE

- No printable synthetic on the market is 100% stain proof. Stains depend on the substance (ie. coffee, mustard, etc.) and how long it sits on the synthetic before being cleaned or wiped off. Many synthetic products can resist stains from various non-alcoholic beverages and common condiments. If the material becomes stained, please follow our recommended cleaning procedure with bleach.

CLEANING

- Domestic bleach such as Clorox® and store-branded thick bleaches (containing sodium hyperchlorite with up to 10% active chlorine and surfactants) are excellent cleaners and useful for removing stains. We recommend diluting thick bleach with tap water to a 1:1 ratio. Stained prints should be immersed in bleach solution and allowed to stand. In the majority of cases, 90% of a stain can be bleached with 10 minutes immersion. To fully remove stains, we recommend 2 hour immersion. Once removed from the bleach solution, the material should be rinsed thoroughly with tap water and dried with a non-abrasive cloth. Please refer to the bleach manufacturer's guidelines on the container for any further instruction and safety procedures.
